

Abhishek Sachdeva

Product Manager | Product Owner | AI and GenAI Products

abhisheksachdeva05@gmail.com | +91-9315101199 | github.com/abhee05

Profile

Product professional with 6+ years of experience across product delivery, business analysis and data-driven initiatives in financial services, pension operations, workforce planning and AI/GenAI solutions. Experienced in understanding user problems, defining MVP features and success metrics, and prioritizing roadmaps by business value. Work closely with business, design and engineering teams to deliver features and improve products using data and user feedback.

Skills

Product management: Problem discovery, user and stakeholder interviews, product requirements, MVP definition, feature prioritization, product roadmap, success metrics and KPIs, release planning.

Product ownership: Backlog creation and refinement, epics, user stories, acceptance criteria, sprint planning support, dependency management and scope trade-offs.

Data and metrics: KPIs, feature adoption tracking, baseline vs. outcome analysis, SQL, Power BI and Tableau.

Delivery and analysis: Agile/Scrum, stakeholder management, requirements elicitation, process analysis, business rules, UAT, defect triage, Jira and Git.

AI product knowledge: LLMs, RAG, AI evaluation, prompt engineering, grounded answers and source citations.

AI prototyping and workflow automation: Cursor, n8n, Lovable, Google Stitch; API integrations and Vercel deployment.

Prioritization frameworks: MoSCoW, RICE and WSJF.

Professional Experience

Product Owner | Deloitte Shared Services India | Oct 2025 - Present

- Work with business stakeholders to understand user problems, expected outcomes and business rules; define product scope, MVP features and success metrics.
- Own the backlog and short-term roadmap; write epics, user stories and testable acceptance criteria in Jira.
- Prioritize features by business value, user impact, urgency and dependencies; communicate trade-offs and align stakeholder expectations.
- Partner with engineering and design teams during sprint planning and execution; clarify requirements and resolve blockers and dependencies.
- Coordinate UAT and releases; track post-release feedback and feature adoption to plan improvements.

Business Analyst | Wipro HR Services Pvt Ltd | Jul 2019 - Apr 2022

- Partnered with operations and onshore stakeholders to define problems, business rules and expected outcomes for forecasting and pension validation initiatives.
- Translated requirements into product scope, epics, features, user stories and acceptance criteria; created and refined backlogs to support incremental delivery.
- Prioritized the core workflow before reliability and reporting enhancements, balancing business value, data readiness and technical dependencies.
- Clarified requirements during delivery, coordinated stakeholder reviews and UAT, and triaged unexpected results with business and technical teams before retesting.

Specialist | HCL Technologies | Feb 2015 - May 2019

Business Analysis Responsibilities | Feb 2017 - May 2019

- Gathered HR and internal reporting requirements, analyzed current processes and business data using SQL, and translated findings into reporting improvements.
- Analyzed 100K+ HR and financial records, built Power BI KPI dashboards and presented recommendations to stakeholders; reduced manual reporting effort by 40%.

Network Engineer | Feb 2015 - Jan 2017

- Supported Cisco network infrastructure, investigated incidents and documented technical changes and support resolutions.

Technical Support Consultant | Techvedic Technologies Pvt Ltd | Feb 2014 - Jan 2015

Resolved software issues for UK and US customers and communicated problems, solutions and next steps clearly.

Career Break | May 2022 - Sep 2025

Managed family business operations following my father's passing until closure in 2024; subsequently refreshed skills in requirements analysis, stakeholder management and Agile delivery before returning to employment.

Selected Projects

Document-Aware AI Assistant | Deloitte internal AI initiative

Problem: Enterprise users spent around 15 minutes per query searching scattered policy and process documents for information.

- Defined the use case, target users and MVP scope; set success metrics for answer accuracy, citation accuracy, time to find information and pilot adoption.
- Prioritized core MVP features: document upload, natural-language questions, RAG-based answers with source citations, and a clear response when documents do not contain the answer.
- Ran UAT with a benchmark set of 150 representative questions to measure answer relevance and citation accuracy; used results to prioritize the next backlog items.
- Worked with engineering on retrieval and prompt improvements that reduced unsupported answers by 60% and raised answer accuracy from 68% to 89%.

Impact: Reduced average time to find information from ~15 minutes to under 3 minutes; adopted by 120+ pilot users across 3 teams with 90%+ citation accuracy.

Automated Call Volume Forecasting | Workforce planning

Problem: Capacity managers relied on manual staffing estimates, making hiring, budgeting and service-level planning difficult.

- Gathered planning needs, 3 years of historical data requirements and assumptions around trends, weekdays and seasonality; defined scope, features and success metrics such as forecast accuracy against actuals.
- Prioritized core features: data validation, time-series forecast generation for a selected period, comparison against the existing baseline and a Power BI planning report.
- Validated forecasts through historical comparisons and variance checks; investigated unusual results with business and technical teams and improved them in later iterations.

Impact: Improved forecast accuracy from ~80% with manual estimates to ~93%, and cut monthly planning effort from 2 days to about 4 hours.

Pension Estimates Validation | Pension operations

Problem: Operations users manually reviewed ~5,000 pension estimates every month to identify unusual calculations.

- Mapped the current validation process, business rules and data assumptions; defined success metrics for manual review volume, false-positive rate and review time.
- Prioritized features for data quality checks, anomaly-based flagging of unusual estimates, a user review workflow and reporting.
- Tested with normal and unusual estimates; refined data assumptions with business and technical teams to reduce false positives from 30% to 8% before acceptance.

Impact: Reduced estimates requiring manual review by 65%, saving the operations team around 25 hours per week.

HR Reporting and Process Improvement | HCL business analysis

Problem: Manual HR reporting required repeated data consolidation and gave limited visibility into operational KPIs.

- Gathered requirements from stakeholders and agreed 15+ KPI definitions, report outputs and data needs.
- Used SQL to extract, validate and analyze 100K+ HR and financial records; identified trends, discrepancies and recurring reporting issues.
- Built 6 Power BI KPI dashboards, presented insights and recommendations, and incorporated stakeholder feedback.

Impact: Reduced manual reporting effort by 40% and moved monthly reporting from spreadsheets to self-service dashboards.

Education

Bachelor of Technology | BRCM College of Engineering and Technology, Bahal | 71.25%
